RISK PROFILE RANGE

This portfolio holds more equity exposure than a medium risk portfolio but less than a high-risk portfolio. In turn the expected volatility is higher than a medium risk portfolio, but less than a high-risk portfolio. The probability of losses is higher than that of a medium risk portfolio, but less than a high-risk portfolio and the expected potential long term investment returns could therefore be higher than a medium risk portfolio. Where the asset allocation contained in this MDD reflects offshore exposure, the portfolio is exposed to currency risks. The portfolio is exposed to equity as well as default and interest rate risks. Therefore, it is suitable for medium to long term investment horizons.

RETURNS

As of Date: 2025/10/31

Highest and lowest rolling returns indicate what an investor would have realized while being invested in the fund over any 12month period since the fund inception date. Investment returns and fees/expense ratios calculated with reference to Class B1. Investment returns are calculated using net NAV to NAV numbers with income reinvested. The performance for each period is reflected in the return for investors who have been fully invested for that period. Individual investor performance may differ as a result of initial fees, the actual investment date, the date of reinvestments and dividend withholding tax. Full investment return calculations are available from the manager on request.

Annualised return is the geometric compound growth rate over the period measured.

Illustrative investment performance together with portfolio performance tables may only be used to show the effect of costs and other factors that impact investment performance and not for showing portfolio performance.
